*Medicago sativa* (yersin)

Yersin, a type of *Medicago sativa*, is a common forage plant known for its tolerance to salinity. The evaluation of *Medicago sativa* lines for salinity tolerance was conducted to identify cultivars suitable for areas with saline conditions. The study was conducted under controlled conditions, and the results indicated that certain lines exhibited better performance under saline conditions. The findings suggest that *Medicago sativa* has potential for cultivation in saline environments, offering a viable alternative for farmers in such regions. Further research is needed to optimize the selection process and determine the most suitable cultivars for specific environments.
