Evaluation of azospirillum, mycorrhiza and streptomyces efficiency with manure utilization in wheat by using $^{32}$P

Each of these microorganisms significantly increased the efficiency of phosphorus absorption by wheat plants.

The addition of manure to the soil significantly increased the growth and yield of wheat plants compared to the control group.

The results showed that the combination of azospirillum, mycorrhiza and streptomyces with manure utilization increased the efficiency of phosphorus absorption by wheat plants.

The results of this study can be used to develop strategies for increasing the efficiency of phosphorus absorption by wheat plants in agronomic practices.
