Chromosomal localization of genes mediating tolerance to boron in pea (Pisum sativum L.) using molecular markers

Abdollahzadeh Farhadi, Farshad, and Rajeini, J. R.

Abstract

This study aimed to localize genes mediating tolerance to boron in pea (Pisum sativum L.) using molecular markers. The researchers used RFLP and RAPD markers to analyze the chromosomal localization of these genes. They found that the genes are located on different chromosomes, providing insights into the genetic basis of boron tolerance in pea.
